Brand Colours

All Legalesign illustrations should follow an **analogous** colour palette, using one segment of the colour wheel between **Teal** and **Indigo**.

Legalesign Brand Blue spans **three Hues: 211 - 222 - 234**, keeping branding assets consistent with the logo; which uses the same **stepped tonal palette**.

The **brand neutrals** are used as **background colours** throughout Legalesign and should **not be used within illustrations**. Neutrals, however, should be kept in mind as all illustrations **must have sufficient contrast on all background variations**

Use:

IBM Plex is the primary typeface family used in all customer facing material. For consistency it is used within the product, on the website and for all marketing material. It is recommended to only use three font weights: Semibold, Medium and Regular. Stylistic 'g' and 'a' should not be used for lengthy copy and reserved for instances where larger font sizes are being used. IBM Plex Mono is used for detail text e.g. labelling, eyebrows, footers etc.

Fifth Element - LS Ribbon

When to use:

LS Ribbons are used across all Legalesign assets. Ribbons can be used functionally to lead to viewers eye or balance a composition

As a fifth element ribbons can be used in isolation representing the brand in situations that don't have the Legalesign logo

How to use:

Ribbons are constantly in motions this can be used to give feeling of dynamism.

They should be used to portray the transfer of secure data and can be used in place of humans to produce actions.

The ribbons should also be used in instances when representing the secure precise technical nature of Legalesigns product line.

Ribbons along with all illustration should be drawn in an **isometric perspective**.

Ribbon in Motion

Asset Types

This illustration guide categorises brand assets as four different types. The relevant asset type should be chosen in line with the type of information to be shown and the situation in which the asset will be placed.

These asset types are unique to Legalesign and the rules and parameters for each will be outlined and specified later in this document.

The types are:

Type One: Pictogram

Legalesign Pictograms are a **branded icon-set** intended for in-app and marketing use.

Pictograms are a flat, simplistic asset type for conveying simple, functional ideas.

Pictograms are componentised within the **Design System**, of both **Designer and Developer Softwares**, and used throughout UI interfaces to add visual stimulus and additional branded elements.

Type Two: Infostration

Awaiting Update

Infostrations are a unique Legalesign asset type, combining illustration with infographic techniques.

These assets are intended for use across main website and marketing material. They are used to display data, and can be used interchangeably with traditional infographic types such as graphs.

These are used to add personality and visual quality to otherwise plain data.

Type Three: Pictostration

Awaiting Update

Pictostrations are a unique Legalesign asset type which combines **pictogram styling with illustration**. These assets are intended for in-app and main website use.

They are constructed using **vector elements**, allowing them to be imported to the front-end code and re-coloured.

Pictostrations adopt the 'legalesignverse' language yet communicate functional ideas and application features.

Type Four: Illustration

Pure Illustration type assets are intended for use only in marketing and on the main company website. Illustrations convey more **metaphorical ideas** and are an opportunity to express the **human side of Legalesign**.

These are done using **traditional digital drawing techniques**, using textures and gradients to create a **tactile feel**.

Illustrations are produced as **Raster images** and are **brand specific**. They are not intended to be recoloured or be white-labellable.

Illustration Style Guidelines

Colour Palette

Illustrations should be coloured in an **analogous** colour palette in the teal - indigo range. The LS Blue colour palette should be used as the primary colour for all illustrations

Self Containing

Illustrations must be **self containing**, meaning that illustrations **should not** have **cut off edges** due to constraints of art-board perimeters

Perspective

Illustrations excluding pictograms should be drawn in an **isometric perspective** - pictograms should use a **flattened iso perspective** or elevation

Transparency

Illustrations should be exported with a transparent background. Illustrations are used in a variety of places throughout Legalesign - this should be kept in mind when designing illustrations. All edges must have high enough contrast against both brand dark and light neutrals

Illustration Style Guidelines

Shading

All Illustration elements are coloured with a solid fill and shading is added using a noise or grain brush on the layer above. The background colour of elements is chosen in a way that creates a balanced composition and an even spread of dark, mid and light tones throughout. Shadows on elements are added using a colour 2-steps darker than the background colour, and highlights added using a colour 2 steps lighter than the background colour in the Legalesign Blue tonal scale.

For example, an element with background LSBlue-50 would be shaded using LSBlue-70 for shadows and LSBlue-30 for highlights. Additionally, thin edge highlights may be added to help items pop in the composition. Edge highlights use LSBlue 4 shades lighter than the chosen background colour.

For all instances where the background colour is LSBlue10, highlights are added in White. And, where the background colour is LSBlue-100, shadows are added in LSBlue-100 with blend mode 'multiply' applied to the layer.

This colouring method is guidance and helps to achieve a consistent look across multiple assets, but is subject to artist's opinion where minor tweaks may improve the assets appearance.

Illustration Style Guidelines

Lighting and Shadows

Harsh direct lighting should be used to cast shadows - should be designed into the composition to help lead the viewers eye. Use this to create sufficient contrast between foreground and background

Form

Objects should be illustrated using simplistic forms. Shapes should be majority angular but can have softer elements used sparingly. Abstract forms and exaggerated scenario can be used when representing conceptual ideas

Format

A square format is preferred for all illustrations however this does not mean illustrations are constrained to a square - this is more a rough guidance

Informative

Illustrations focus around a core message and used to aid in viewers understanding. Conveying a message does not need to be literal, instead can be more abstract. Something a little unusual will catch attention and stay in the users mind - helping with information retention

Pictogram Style: Grid

Pictograms are heavily influenced by the brand Language, adopting sharp corners and continuous lines.

They are designed to intentionally feel bold, clear-cut and precise, embodying brand messages.

Grid

All pictograms should be ***Pixel Perfect*** and build on a **24px Pixel Grid**.

Elements should generally be **spaced at 2px**, though **1px** may be used in some cases and should always be used when depicting lines of text.

Pictogram Style: Strokes and Colours

Stroke

All pictograms should be build using 1px strokes. Dashed line details should use **dash/gap ratio** of either: **2px/1px** or **1px/1px**.

Colours

Pictograms can be addapte to fit both Dark and Light mode interfaces and documentation.

Main and Accent colours are used at a rought ratio of **20:80**. Although small variation in ratio may be used to achieve better overall visual balance.
